

EVEREADY TUBULAR FLASHLIGHTS

Tubular Flashlights are used extensively by inspectors and others whose work is in places where a strong steady illumination is needed. The switch for turning the light on or off is by the same hand that carries the flashlight.

These flashlights are equipped with two types of switches, the slide switch and the spring switch.

The slide switch is controlled by a pressure of the thumb in either direction. To turn the light on the slide is gently pressed forward; to extinguish the light the slide is pressed backward to its original position. The spring switch is located at the lower end of the flashlight. The light can be flashed on or off quickly by pressing the metal tongue against the cap.

These lights are extremely compact, the entire case being but a little larger than the battery it contains.

Nickel Plated Tungsten Flashlights
Flash and Permanent Contact

The tungsten battery has made it possible to produce practical flashlights that are actually vest pocket size. The smallest, known as the "Midget," is so tiny that it can be carried in a lady's purse. Equipped with Eveready Tungsten Batteries and Eveready Mazda Lamps they give a surprisingly powerful white light, and the battery, with average use, will usually last from two to four months.

Cases sturdily made and beautifully finished in polished nickel. Sliding contact and button for flash or continuous light.

"Fountainlight" Flashlight

The "Fountainlight" Flashlight is an exact imitation of a fountain pen with barrel, cap and clip, which creates a new and novel departure from the ordinary type of flashlight. Its dimensions are such that it becomes a veritable vest pocket flashlight, causing no inconvenience whatever in carriage. "For light" press the ball of the clip—there will be no hitch. "For no light" carry the "Fountainlight" like a fountain pen in the pocket with the cloth of the pocket between the clip and casing. Contact is then impossible, the cloth acting as an insulator, thus preventing to a certainty the useless consumption of the battery in the pocket.

Nickel Plated Tungsten Flashlights

VEST POCKET TYPE

This type flashlight opens exactly like a cigarette case. The beauty of design as well as convenience and ease of replacing the battery and lamp are plainly shown in the cut above.

When a fresh battery is inserted it is instantly apparent whether the battery terminals are in the right position to make contact with the lamp and sliding switch, saving time and trouble.

Notice the thin and neat appearance and the rounded corners without projections to wear the pocket. The same batteries and lamps are used in this new design as in the other styles of nickel plated vest pocket flashlights shown in the preceding page and the sizes are practically the same.

Nickel Plated Tubular Tungsten Flashlights

The cases are made entirely of brass, heavily nickel plated, which especially adapts them for use around motor cars, motor boats, or wherever the hands of the user are likely to be oily or wet. These cases should last indefinitely under almost any conceivable conditions. They are thoroughly insulated and there is no possibility of short-circuiting the battery through contact with other metal objects.

Vest and Coat Pocket Tungsten Flashlights

These flashlights throw a powerful light for a considerable distance. The light is instantly available and absolutely safe. They can be used around the automobile and gasoline tank where a match would be dangerous and might cause an explosion.

The vest and coat pocket flashlights are equipped with a slide switch similar to that used on the tubular flashlights—one hand holds the flashlight and operates the slide. When required, the flashlight may be laid down, leaving both hands free.

2675 Pistol Light, complete	\$2.00
750 Renewal Tungsten battery	.40
1180 Renewal Mazda bulb, 2.5 volts	.20

Tungsten Gas and Range Lighters

The Gas Lighter has a socket which is used to turn on the gas if the fixture is high. The same hand that turns on the gas presses the switch that operates the lighter. When this switch is pressed a current is projected through the platinum coil, contained in the perforated tip of the lighter. This coil instantly becomes white hot and stays in that condition as long as the switch is held down. No draught can blow it out. The shape and length of these lighters make them invaluable where the Welsbach type of burner is used.

The Range Lighter operates in the same way, but there is a difference in design. The hand is far from the flame when it ignites, preventing burned fingers.

Battery case of vulcanized fibre. All metal parts nickel plated.
